

get your sh*t together

a personal productivity app with layers instead of one long list. built for a brain that does better when the day assembles itself. this page is the tour, and the very end is how you get your own copy.

| type anything. enter. it lands in the inbox.

☐ frog

that bar sits at the top of every page. capture the thought before you lose it and get back to your life; sorting is a separate, later decision. the frog box is for tasks you dread.

home

the page that assembles your day for you.

- **your horizon:** a few lines you write about where all this is going. it stays at the top so the day-to-day connects to something.
- **today:** picked automatically from everything else: pinned tasks, the next assignment due, a learn item in progress, bills that need paying, routines that are due, calendar events if connected. each has a tick. that is the whole interaction.
- **frog pen:** the dreaded tasks wait here (eat the frog). each shows how long it has been waiting, without judgment. tick it, snooze it, or drop it; "blitz" walks you through them one at a time.
- **tiles:** one per tab, each a one-glance summary. click through when something needs you.

captured thoughts sit in the inbox until you sort them: pin to today, send to a work area, frog it, or drop it. anything pinned that rots untouched gets offered a sweep back to the inbox instead of guilt.

work

one area per job, school, or side gig

school areas hold classes and assignments (with canvas sync if configured); job areas hold tasks grouped into named areas you define.

every work task takes a deadline: exact ("sep 12"), approximate, or just "soon", typed in any natural format. each also gets a burden computed from a time slider and a dread level, and lists sort by deadline with the heaviest first, so the top of the list is always the honest answer to "what should I start?"

life

sections you switch on and off

- **routines:** recurring upkeep that resurfaces when due. no streaks are kept, so being late never accumulates.
- **financials:** organized by what you have to do. "to pay" is bills you pay by hand, tick advances the date. "decide before it renews" surfaces renewals two weeks early so you keep or cancel on purpose. "on autopilot" is a quiet ledger of autopay charges with your monthly recurring load. cards carry a name, what to use it for, the payment due date, and daily / on occasion / dead.
- **appointments:** needs-booking versus booked, so nothing slips between.
- **groceries and packing:** reusable templates that stamp out a fresh checklist per run or trip.
- **evening plans:** loose after-work lists with time blocks; give the plan a start time and every item gets a clock time.

nothing is deleted when a section is off; it just leaves the screen.

model

for thinking, not tasks

a model is a page of categories (they nest, with unlimited depth) holding cards, plus a notes box that saves itself. lay out a decision, a move, a project, anything you need to see spatially. you can also import a notion export and turn any notion database into a model in one click.

learn

dependency trees for what you are learning

categories start empty; nothing is pre-populated. add items by hand, or import your chatgpt or claude history and map old learning chats into the trees. items can require other items, so each category shows a frontier: what you are ready to learn next. tick items as

you learn them, mark any number as "learning now", and a day streak logs itself. categories rename, merge, and delete; items drop.

pause

anti-impulsivity

caught yourself about to buy, order, or send something? park the impulse behind a timer, thirty minutes to indefinite. when it runs out you decide again, calmly. the record keeps both outcomes plus your own worth-it verdicts. the stat that matters: how many impulses waiting killed for free.

rescue

for flat days

a list of things that have ever helped, even once, even forced. it suggests one at a time and keeps an honest count of how often each actually helped, so the list gets smarter about you.

get your own copy

everything is yours alone: your own copy of the app, your own database, one password. your data never touches anyone else's server.

on your own machine (mac or linux, python 3.11+):

```
git clone https://github.com/s-eun-young-g/get-your-sh-t-together.git
cd get-your-sh-t-together
python3 -m venv .venv
./venv/bin/pip install -e "[dev]"
./venv/bin/python -m strata.app
```

then open **localhost:8020**. on a mac, double-clicking **run.command** in the folder does all of the above.

online (reachable from your phone, about a dollar a month): follow the launch section of the [readme](#). set a password first; the app requires it before deploying.

optional connections, each one line in a .env file: google calendar on your home page, canvas assignment sync, a capture endpoint for slack and iOS shortcuts, and a claude key for mapping imports.

the settings page inside the app shows what is on and how to turn on the rest.

made by sofia. the full guide also lives in the repo as GUIDE.md.
